SECURITY OPERATIONS CENTER | PRACTICAL PROJECT

WEEK ONE EVIDENCE REPORT

Wazuh SIEM setup, endpoint log integration, event review, and retention configuration.

WAZUH SIEM LAB | WEEK ONE EVIDENCE

Architecture • Log Collection • Detection • Retention

Evidence Overview

This document organizes the supplied Wazuh screenshots into a clear implementation sequence. Each figure is followed by a short explanation describing what is visible and what it demonstrates. The screenshots are presented as practical evidence, not as claims of activity beyond what the captured views show.

Implementation sequence

01 Architecture	Understand how endpoint logs flow through the Wazuh components.
02 Agent integration	Register Windows and Kali Linux as monitored endpoints.
03 Event review	Review Kali authentication activity and Windows failed-logon alerts.
04 Retention	Configure and verify a 90-day alert-index retention policy.

01 | SIEM Architecture

This diagram presents the Wazuh SIEM lab architecture. Windows and Kali Linux endpoints send their logs through Wazuh agents to the Ubuntu server. The Wazuh Manager analyzes events and applies detection rules; Filebeat forwards events to the Indexer for storage and indexing; the Dashboard provides search, visualization, alerts, and investigation for the SOC analyst.

02 | Log Source Integration

This screenshot shows the two registered Wazuh agents: Windows-Agent-001 (ID 003) and Kali-Linux (ID 002). At the time of capture, the Windows agent is Active while the Kali agent is Disconnected. This confirms that both endpoints were registered, while also documenting their connection status at that moment.

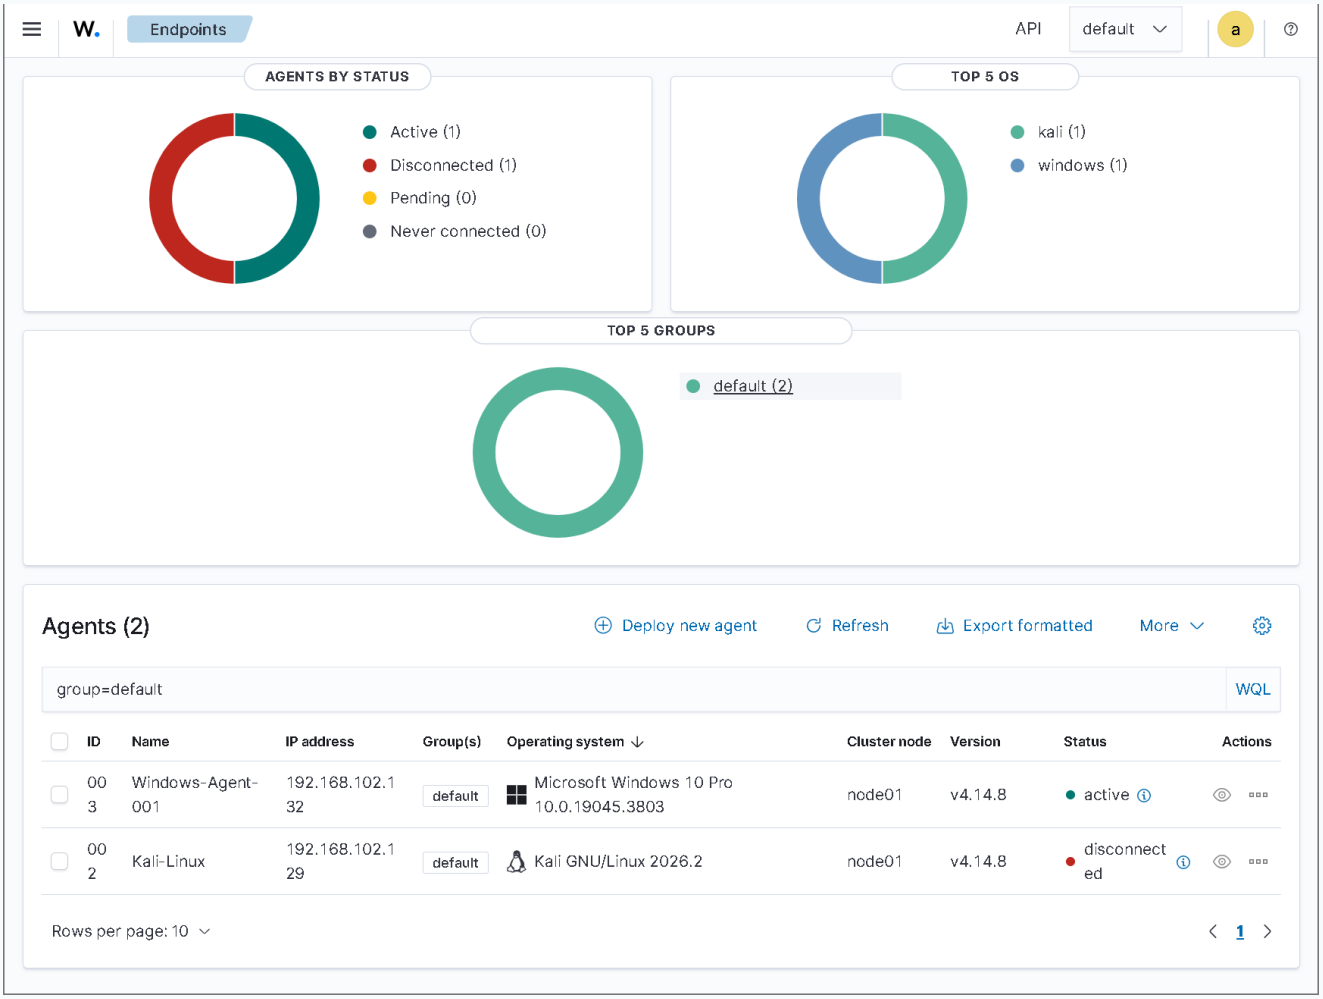

Figure 2. Log Source Integration — supplied Wazuh lab screenshot.

03 | Kali Linux Authentication Logs

This Threat Hunting view displays 62 events from the Kali-Linux agent during the selected time range. The visible records include PAM login-session activity and authentication-related events, including a failed password check and a user-login failure. These logs provide evidence that Kali authentication events were being collected and could be reviewed in Wazuh.

04 | Windows Failed Logon Detection

This view is filtered for Wazuh Rule ID 60122 and shows six Windows logon-failure alerts. The rule description identifies an unknown user or an incorrect password, and the alerts are shown at Rule Level 5. This demonstrates the collection and detection of controlled failed-login test events.

timestamp	agent.name	rule.description	rule.lev...	rule.id
Oct 19, 2026 @ 19:23:59....	Windows-Agent-001	Logon Failure - Unknown user or bad password	5	60122
Oct 19, 2026 @ 19:22:07....	Windows-Agent-001	Logon Failure - Unknown user or bad password	5	60122
Oct 19, 2026 @ 19:22:05....	Windows-Agent-001	Logon Failure - Unknown user or bad password	5	60122
Oct 19, 2026 @ 19:22:03....	Windows-Agent-001	Logon Failure - Unknown user or bad password	5	60122
Oct 19, 2026 @ 19:22:02....	Windows-Agent-001	Logon Failure - Unknown user or bad password	5	60122
Oct 19, 2026 @ 19:21:59....	Windows-Agent-001	Logon Failure - Unknown user or bad password	5	60122

05 | 90-Day Log Retention Policy

This screenshot shows the Wazuh Index State Management policy named “wazuh-alerts-retention-90d.” It targets the “wazuh-alerts-*” index pattern and defines a transition to the “delete_alerts” state when the minimum index age reaches 90 days. The destination state contains a Delete action.

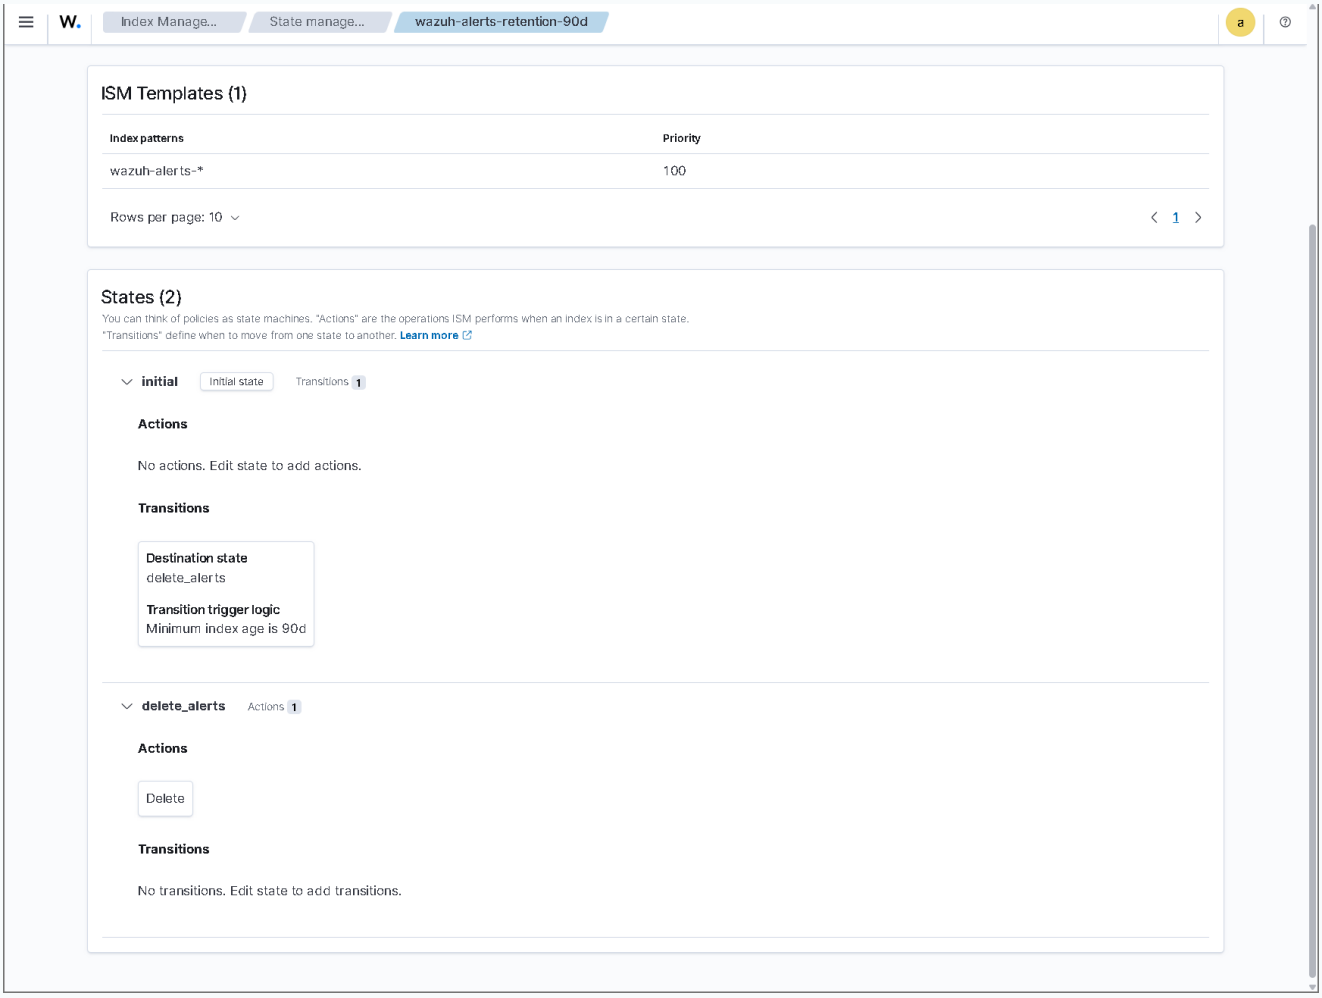

Figure 5. 90-Day Log Retention Policy — supplied Wazuh lab screenshot.

06 | Retention Policy Applied

This view shows one index managed by the retention policy. Its current state is “initial,” the action is “Transition,” and the job status is “Running.” This confirms that the policy is attached to a managed index and that the management job is active in the captured view; it does not indicate that an index has already been deleted.
